

L15: Solidity Fundamentals

Module B: Ethereum & Smart Contracts

Blockchain & Cryptocurrency Course

December 2025

By the end of this lesson, you will be able to:

- Understand Solidity's role as a smart contract language
- Declare and use fundamental data types (uint, address, bool, string, bytes)
- Write functions with appropriate visibility and state mutability modifiers
- Implement events for logging and monitoring
- Use mappings and arrays for data storage
- Apply inheritance and interfaces

What is Solidity?

Solidity is a statically-typed, contract-oriented programming language:

- Created specifically for Ethereum smart contracts
- Syntax similar to JavaScript/C++, compiles to EVM bytecode
- Current stable version: 0.8.x (as of 2025)

Solidity Compilation Pipeline

Every Solidity file starts with a version pragma:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.0;

contract HelloWorld {
    string public message;

    constructor(string memory initialMessage) {
        message = initialMessage;
    }

    function setMessage(string memory newMessage) public {
        message = newMessage;
    }

    function getMessage() public view returns (string memory) {
        return message;
    }
}
```

Key Elements: License identifier, pragma, contract declaration, state variables, constructor, functions

Required at top of every Solidity file:

Common Licenses:

- **MIT:** Permissive open-source license
- **GPL-3.0:** Copyleft license (derivatives must be open-source)
- **UNLICENSED:** Proprietary code

Version Pragma:

- `pragma solidity ^0.8.0;` - Compatible with 0.8.0 to 0.8.x
- `pragma solidity >=0.8.0 <0.9.0;` - Range specification
- `pragma solidity 0.8.20;` - Exact version

Solidity has two categories of data types:

Solidity Data Types

Value Types

uint/int uint256, int128...

address 20-byte Ethereum addr

bool true/false

bytes1-32 Fixed-size bytes

enum User-defined states

Copied when assigned
Stored directly in memory/storage

Reference Types

arrays uint[], string[]

mappings mapping(K => V)

structs Custom data types

string Dynamic UTF-8

bytes Dynamic byte array

Passed by reference
Require data location (storage/memory/calldata)

Integers:

- `uint` (unsigned): 0 to $2^{256} - 1$ (alias for `uint256`)
- `int` (signed): -2^{255} to $2^{255} - 1$ (alias for `int256`)
- Sized variants: `uint8`, `uint16`, ..., `uint256`

Booleans:

- `bool`: `true` or `false`
- Operators: `!` (not), `&&` (and), `||` (or)

```
contract Types {  
    uint256 public largeNumber = 1000000000000000000; // 1e18  
    uint8 public smallNumber = 255; // Max value for uint8  
    int256 public signedNumber = -42;  
    bool public isActive = true;  
}
```

Address type holds 20-byte Ethereum addresses:

- address: Basic address type
- address payable: Can receive Ether via transfer() or send()

Address Members:

- <address>.balance: Returns Ether balance (in Wei)
- <address payable>.transfer(uint amount): Send Ether, reverts on failure

```
contract AddressExample {
    address public owner;
    address payable public recipient;

    constructor() {
        owner = msg.sender; // Address of contract deployer
        recipient = payable(msg.sender); // Convert to payable
    }

    function checkBalance() public view returns (uint) {
        return owner.balance; // Balance in Wei
    }
}
```

Fixed-Size Arrays:

```
uint[5] public fixedArray; // Array of 5 uints
```

Dynamic Arrays:

```
uint[] public dynamicArray;  
string[] public names;  
  
function addElement(uint value) public {  
    dynamicArray.push(value); // Append to array  
}  
  
function getLength() public view returns (uint) {  
    return dynamicArray.length;  
}  
  
function removeLastElement() public {  
    dynamicArray.pop(); // Remove last element  
}
```

Key-value storage (like hash tables):

```
contract MappingExample {
    // Mapping from address to balance
    mapping(address => uint256) public balances;

    // Nested mapping (address to address to allowance)
    mapping(address => mapping(address => uint256)) public allowances;

    function updateBalance(address account, uint256 amount) public {
        balances[account] = amount;
    }

    function getBalance(address account) public view returns (uint256) {
        return balances[account]; // Returns 0 if key doesn't exist
    }
}
```

Key Properties: All keys exist with default value, cannot iterate, only in storage

Four visibility levels determine who can call a function:

Solidity Function Visibility Access				
	External	Same	Derived	
public	Y	Y	Y	Can Access
external	Y	N	N	Cannot Access
internal	N	Y	Y	
private	N	Y	N	

(EO Tip: Use external for gas efficiency when only called from outside)

Three state mutability levels:

- ① **view**: Reads state but doesn't modify it (no gas when called off-chain)
- ② **pure**: Doesn't read or modify state
- ③ **(none)**: Can read and modify state (always costs gas)

```
contract Mutability {
    uint public value = 10;

    function getValue() public view returns (uint) {
        return value; // Reads state (view)
    }

    function add(uint a, uint b) public pure returns (uint) {
        return a + b; // No state access (pure)
    }

    function setValue(uint newValue) public {
        value = newValue; // Modifies state (no modifier)
    }
}
```

Data Locations: storage vs memory vs calldata

Reference types require explicit data location:

Events enable logging for off-chain monitoring:

```
contract EventExample {
    event Transfer(address indexed from, address indexed to, uint256 amount);
    event Approval(address indexed owner, address indexed spender, uint256 amount);

    mapping(address => uint256) public balances;

    function transfer(address to, uint256 amount) public {
        require(balances[msg.sender] >= amount, "Insufficient balance");
        balances[msg.sender] -= amount;
        balances[to] += amount;
        emit Transfer(msg.sender, to, amount); // Emit event
    }
}
```

Indexed Parameters: Up to 3 parameters can be indexed for efficient filtering

Solidity provides multiple error handling mechanisms:

- ❶ **require(condition, message):** Validate inputs/conditions, refunds gas
- ❷ **assert(condition):** Check invariants (should never fail)
- ❸ **revert(message):** Unconditional revert with message

```
function transfer(address to, uint amount) public {  
    require(to != address(0), "Cannot transfer to zero address");  
    require(balances[msg.sender] >= amount, "Insufficient balance");  
  
    balances[msg.sender] -= amount;  
    balances[to] += amount;  
  
    assert(balances[msg.sender] + balances[to] == totalSupply); // Invariant  
}
```

More gas-efficient than string error messages:

```
contract CustomErrors {
    error InsufficientBalance(uint requested, uint available);
    error Unauthorized(address caller);

    address public owner;

    function withdraw(uint amount) public {
        if (msg.sender != owner) {
            revert Unauthorized(msg.sender);
        }
        if (balances[msg.sender] < amount) {
            revert InsufficientBalance(amount, balances[msg.sender]);
        }
        // ... transfer logic
    }
}
```

Benefits: Lower gas cost, typed parameters, better error context

Reusable code for function preconditions:

```
contract ModifierExample {
    address public owner;
    bool public paused = false;

    constructor() { owner = msg.sender; }

    modifier onlyOwner() {
        require(msg.sender == owner, "Not the owner");
        _; // Placeholder for function body
    }

    modifier whenNotPaused() {
        require(!paused, "Contract is paused");
        _;
    }

    function pause() public onlyOwner { paused = true; }
    function unpause() public onlyOwner { paused = false; }

    function criticalFunction() public onlyOwner whenNotPaused {
        // Only owner can call, and only when not paused
    }
}
```

Solidity supports multiple inheritance:

```
contract Ownable {
    address public owner;
    constructor() { owner = msg.sender; }
    modifier onlyOwner() {
        require(msg.sender == owner, "Not owner");
        _;
    }
}

contract Pausable is Ownable {
    bool public paused;
    function pause() public onlyOwner { paused = true; }
}

contract MyContract is Pausable {
    function doSomething() public onlyOwner {
        // Inherits owner, onlyOwner, paused, pause()
    }
}
```

Key: is for inheritance, virtual/override for polymorphism

Define contract structure without implementation:

```
interface IERC20 {
    function totalSupply() external view returns (uint256);
    function balanceOf(address account) external view returns (uint256);
    function transfer(address to, uint256 amount) external returns (bool);
    event Transfer(address indexed from, address indexed to, uint256 value);
}

contract MyToken is IERC20 {
    mapping(address => uint256) private _balances;
    uint256 private _totalSupply;

    function totalSupply() public view override returns (uint256) {
        return _totalSupply;
    }
    // ... implement other functions
}
```

- ❶ **Solidity Basics:** Statically-typed language compiling to EVM bytecode
- ❷ **Data Types:** Value types (uint, address, bool) vs reference types (arrays, mappings)
- ❸ **Visibility:** public, external, internal, private determine access
- ❹ **State Mutability:** view (read-only), pure (no state), default (modify)
- ❺ **Data Locations:** storage (persistent), memory (temp), calldata (cheapest)
- ❻ **Error Handling:** Use custom errors (0.8.4+) for gas efficiency

- ❶ Why is `string` more expensive than `bytes32` for storing short text?
- ❷ When should you use `external` vs `public` for function visibility?
- ❸ Why can't you iterate over a mapping's keys in Solidity?
- ❹ What are the tradeoffs between events vs state variables for historical records?
- ❺ How does the `indexed` keyword in events affect gas costs and queryability?

Coming up next (hands-on lab):

- Introduction to Remix IDE
- Deploying SimpleStorage contract
- Interacting with deployed contracts
- Using MetaMask with test networks
- Deploying to Sepolia testnet

Preparation:

- Install MetaMask browser extension
- Create Ethereum account and save recovery phrase
- Get Sepolia testnet ETH from faucet
